

CORROSION

COATING THICKNESS

TECHNICAL BULLETIN CTB-4

Rev 3, November 2003

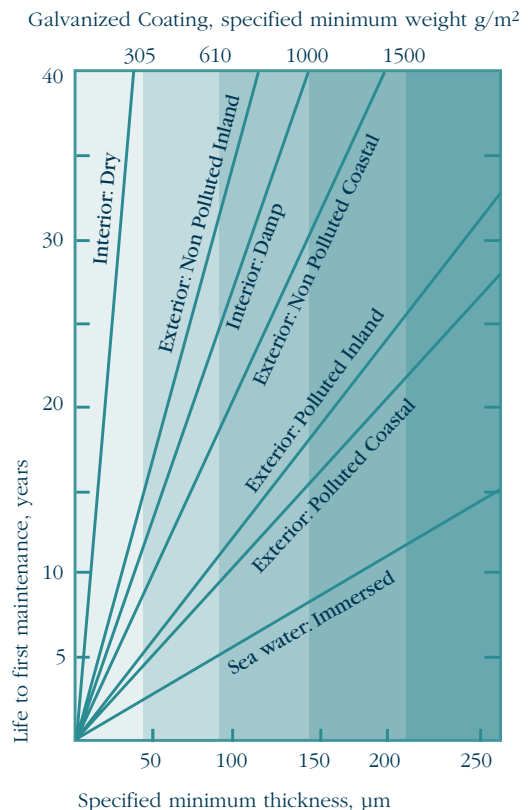

This issue supersedes all previous issues

Hot dipped zinc coatings and electrozinc coatings both protect steel in a similar manner. The main difference is, that hot-dipped zinc coatings are usually thicker and therefore offer a longer life under the same exposure conditions.

The protective life of a metallic zinc coating is essentially a function of the coating thickness. Figure 1 indicates mass loss data for hot-dipped zinc coatings as described in British Standard 5493 1977 Section 2.

This indicates life to first maintenance for galvanized coatings exposed in a wide range of environments. The table is particularly useful because it directly reflects the benefits of increased coating thickness. In general for a particular environment the life of a galvanized coating is directly proportional to the zinc coating mass.

Figure 1: British Standard 5493 1977 Section 2.

The information and advice contained in this Bulletin is of a general nature only, and has not been prepared with your specific needs in mind. You should always obtain specialist advice to ensure that the materials, approach and techniques referred to in this Bulletin meet your specific requirements.
